

John Saint-Smith – The Electric Transition Part 2

How going ‘green’ can save money as well as the planet from climate change and disrupt the fossil fools’ economic stranglehold on the world.

We are the lucky country, but we have been too lucky. Almost all Australian billionaires have made their money in mining, real estate, export agriculture, and banking. Dig it out of the ground, sell it off, and send it overseas, rake in the dollars.

But it’s not working any more. We simply need to stop being satisfied with “*she’ll be right*” and re-discover the pioneering spirit that created the stump-jump plough, rust resistant wheat, fine merino wool, X-ray crystallography, radio astronomy, Wi-Fi, cochlear implants and so many other world leading technologies. Australia has the renewable resources, the entrepreneurial capital, and the technical capacity to lead the world in the transition to renewable energy, all we need is the political will.
